### 1 CRAFTING A COMPILER, CHAPTER 4, EXERCISE 4.7

A grammar for infix expressions follows:

1.  $\text{Start} \rightarrow E\$$
2.  $E \rightarrow T \text{ plus } E$
3.  $| T$
4.  $T \rightarrow T \text{ times } F$
5.  $| F$
6.  $F \rightarrow ( E )$
7.  $| \text{num}$

**a)** Show the leftmost derivation of the following string.

num plus num times num plus num \$

Start

$E\$$

$T \text{ plus } E$

$T \text{ plus } T \text{ plus } E$

$T \text{ plus } T \text{ times } F \text{ plus } E$

$T \text{ plus } T \text{ times num plus } E$

$F \text{ plus } F \text{ times num plus } T$

num plus num times num plus F

num plus num times num plus num

b) Show the rightmost derivation of the following string.

num times num plus num times num \$

Start

E\$

T

T times F

T times ( E )

T times T plus E

T times T plus T

T times T plus T times F

F times F plus F times num

num times num plus num times num

c) Describe how this grammar structures expressions, in terms of the precedence and left- or right- associativity of operators.

A leftmost derivation process always chooses the leftmost possible nonterminal at each step. The nonterminal vaguely describes the terminal terms it can represent, and the result is the production sequence that a top-down parser would discover. A rightmost derivation process is the opposite, meaning the rightmost nonterminal is always expanded first, and this process is typically used by bottom-up parsers. One tricky thing about the rightmost derivation process is that the last step taken in a rightmost derivation is the first production applied by the bottom-up parser.

## 2 CRAFTING A COMPILER, CHAPTER 5, EXERCISE 5.2C

c) Construct a recursive-descent parser based on the grammar:

```
parseValue() {  
  → matchAndConsume(num) {  
    → }  
  → matchAndConsume(lparen) {  
    → → parseExpr() {  
      → → }  
    → → matchAndConsume(rparen) {  
      → → }  
    → }  
  }  
parseExpr() {  
  → matchAndConsume(plus) {  
    → }  
  → parseValue() {  
    → }  
  → parseValue() {  
    → }  
  → matchAndConsume(prod) {  
    → }  
  → parseValues() {  
    → }  
  }  
parseValues() {  
  → parseValue(plus) {  
    → }  
  → parseValues() {  
    → }  
  }
```

### 3 DRAGON BOOK EXERCISE 4.2.1: A, B AND C

a) Leftmost derivation:

$S \rightarrow SS \rightarrow SS+S^* \rightarrow aS+S^* \rightarrow aa+S^* \rightarrow aa+(a)^*$

b) Rightmost derivation:

$S \rightarrow SS^* \rightarrow S+SS^* \rightarrow S+Sa^* \rightarrow S+aa^* \rightarrow a+a(a)^*$

c) Parse tree:
